

INCA GOLD

STONE TYPE

Limestone

FINISH

Polished

ORIGIN

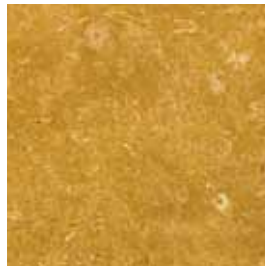

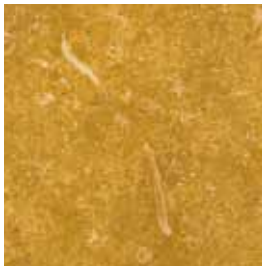

Indus Valley, Pakistan

SIZES

12"x12"x3/8"

RECOMMENDED USES

Commercial & Residential
Interior & Exterior
Floor & Wall
Backsplashes
Countertops
Fireplaces
Tub Surrounds & Showers
Vanities

Inca Gold limestone is quarried from a bedrock quarry in the Indus Valley region of Pakistan. This is a sedimentary stone that is formed on the bottom of a shallow sea bed and is composed mainly of calcite calcium carbonate. One of the unique characteristics of this limestone is the existence of quartz veins and some small shells and fossils that may appear throughout the tile or slabs. Because Inca Gold is one of the harder limestones, it has a tight grain structure and holds a very high polish, which is a unique finishing option for this particular stone. As with any polished product, ongoing maintenance will be required. It is a common characteristic for this stone to have voids in the raw material. Before it reaches polishing stages, these voids are filled with a polyester resin. Depending on how deep the void is, the resin may shrink as it dries, which will leave the surface of the filled area slightly lower than the rest. This does not affect the durability, maintenance or beauty of the stone. There will be noticeable variations in color and movement between pieces. Therefore, it is important and recommended that a range of this product be viewed before finalizing a purchase. As a natural stone product it is recommended that it be sealed to extend its longevity.

NSF indicates this product conforms to the requirements of NSF/ANSI Standard 51, thereby meeting the health and sanitation requirements for materials used in areas of food preparation.
