Picasso Travertine is quarried near the city of Denizli, Turkey. This is a sedimentary stone that is formed in hot springs and is composed of calcite calcium carbonate. All travertine stones will have natural cavities, or pits visible in the stone that developed when carbon dioxide bubbles became trapped during the formation of the stone. The chiseled edges of the pieces in the pattern, along with the unfilled surface, give this pattern an old world, rustic appearance. The chiseled edges of this pattern can make the grout joint appear much larger if not wiped clean during installation. So, it is important to ensure that the edges are cleaned thoroughly after grouting. There will be noticeable variations in color and movement between pieces. Therefore, it is important and recommended that a range of this product be viewed before finalizing a purchase. As a natural stone product it is recommended that it be sealed to extend its longevity.
